What is the value of $\cos \frac{565\pi}{6}$?

- A. $\frac{1}{2}$
- B. 1
- C. $\frac{\sqrt{3}}{2}$
- D. $\sqrt{3}$

ID: f80d5adb Answer

Correct Answer: C

Rationale

Choice C is correct. The cosine of an angle is equal to the cosine of $n (2\pi)$ radians more than the angle, where n is an integer constant. Since $\frac{565\pi}{6}$ is equivalent to $47 \left(2\pi \right) + \frac{\pi}{6}$, $\cos \left(\frac{565\pi}{6} \right)$ can be rewritten as $\cos \left(47 \left(2\pi \right) + \frac{\pi}{6} \right)$, which is equal to $\cos \left(\frac{\pi}{6} \right)$. Therefore, the value of $\cos \left(\frac{565\pi}{6} \right)$ is equal to the value of $\cos \left(\frac{\pi}{6} \right)$, which is $\frac{\sqrt{3}}{2}$.

Alternate approach: A trigonometric ratio can be found using the unit circle, that is, a circle with radius 1 unit. The cosine of a number t is the x-coordinate of the point resulting from traveling a distance of t counterclockwise from the point $(1, 0)$ around a unit circle centered at the origin in the xy -plane. A unit circle has a circumference of 2π . It follows that since $\frac{565\pi}{6}$ is equal to $47 \left(2\pi \right) + \frac{\pi}{6}$, traveling a distance of $\frac{565\pi}{6}$ counterclockwise around a unit circle means traveling around the circle completely 47 times and then another $\frac{\pi}{6}$ beyond that. That is, traveling $\frac{565\pi}{6}$ results in the same point as traveling $\frac{\pi}{6}$. Traveling $\frac{\pi}{6}$ counterclockwise from the point $(1, 0)$ around a unit circle centered at the origin in the xy -plane results in the point $\left(\frac{\sqrt{3}}{2}, \frac{1}{2} \right)$. Thus, the value of $\cos \frac{565\pi}{6}$ is the x-coordinate of the point $\left(\frac{\sqrt{3}}{2}, \frac{1}{2} \right)$, which is $\frac{\sqrt{3}}{2}$.

Choice A is incorrect. This is the value of $\sin \frac{565\pi}{6}$, not $\cos \frac{565\pi}{6}$.

Choice B is incorrect. This is the value of the cosine of a multiple of 2π , not $\frac{565\pi}{6}$.

Choice D is incorrect. This is the value of $\frac{1}{\tan \frac{565\pi}{6}}$, not $\cos \frac{565\pi}{6}$.

ID: 729a31a8

$$(x - 6)^2 + (y - 3)^2 = 81$$

The graph of the given equation in the xy -plane is a circle. What is the length of the radius of this circle?

- A. 3
- B. 6
- C. 9
- D. 81

ID: 729a31a8 Answer

Correct Answer: C

Rationale

Choice C is correct. The equation of a circle in the xy -plane can be written as $x - h^2 + y - k^2 = r^2$, where the center of the circle is (h, k) and the radius of the circle is r . The graph of the given equation, $x - 6^2 + y - 3^2 = 81$, is a circle in the xy -plane. This equation can be written as $x - 6^2 + y - 3^2 = 9^2$, where $h = 6$, $k = 3$, and $r = 9$. Therefore, the radius of this circle is 9.

Choice A is incorrect. This is the y -coordinate of the center, not the radius, of the circle defined by the given equation.

Choice B is incorrect. This is the x -coordinate of the center, not the radius, of the circle defined by the given equation.

Choice D is incorrect. This is the value of the radius squared, not the radius, of the circle defined by the given equation.
